

## Pygmy Shark, *Euprotomicrus bispinatus*

Report Card assessment	Sustainable		
IUCN Red List Australian Assessment	Refer to Global Assessment	IUCN Red List Global Assessment	Least Concern
Assessors	Burgess, G.H.		
Report Card Remarks	One of the smallest sharks that is not likely captured in many fisheries		

### Summary

The Pygmy Shark is a widespread, oceanic species that has been found in numerous locations in the Pacific, Indian and Atlantic Oceans. It is known to use a

Source: Australian National Fish Collection, CSIRO. License: CC by Attribution-NonCommercial

wide range of depths, from the surface to 1,500 m. It is one of the smallest shark species in the world, reaching a total length of 27 cm. It is thought to be too small to be frequently captured in most fisheries. Therefore, there are no apparent threats to the species. Given this, and its large global and depth range, it is assessed as Least Concern (IUCN) and in Australia, Sustainable (SAFS).

### Distribution

The Pygmy Shark is widespread and is found around the world in the warm-temperate and subtropical portions of the Atlantic, Indian, and Pacific Oceans. In Australia, it is currently only known from Western Australian waters (Last and Stevens 2009, Ebert et al. 2013).

### Stock structure and status

There is currently no information on population size, structure, or trend for the species.

### Fisheries

There are currently no apparent threats to the species as it is not known to interact with any Australian fisheries. Its small size and use of a wide range of depths means it is not likely to be captured in most fisheries.

### Habitat and biology

The Pygmy Shark is an oceanic species that occurs from the surface to deeper than 1,500 m over oceans that are 1,829 to 9,938 m deep. It is bioluminescent and makes daily migrations from near the surface at night to midwater and possibly to the bottom during the day (Hubbs et al. 1967, Last and Stevens 2009, Ebert et al. 2013). Maximum size is 27 cm total length (TL), making this one of the smallest known shark species (Last and Stevens 2009, Ebert et al. 2013).

Longevity and maximum size	Longevity: unknown Max size: 27 cm TL
Age and/or size at maturity (50%)	Males: 17-19 cm TL Females: 22-23 cm TL
